CEC completed purging monitoring wells 3, 4, 5, and 6. These monitoring wells are located at the base of the slope behind the facility, downgradient of the tank farm. Following recharge, samples were collected from all four wells. WVDEP and EPA collected split samples from each of the wells. A petroleum odor was noted by WVDEP in the water in all four of the wells; no MCHM odor was detected in the water in any of the wells.

A skeleton crew remains on Site to oversee water pumping operations where required. It is estimated that 1,000 gallons of water per hour is discharging from the pipe at the front of the containment wall. The source of the water is still unknown.

Clean Harbors continues to inspect and maintain the boom in the Elk River.

Approximately 100,000 gallons of water that was pumped from the facility remains staged in Poca, pending treatment and/or disposal. The RP estimates that all of the product on Site will be shipped off

Site by March 15.
